

Regress-scan-regress structure by participant strategy — [organic_hybrid] · three terciles of per-participant regression rate

Definition: an "epoch" is a contiguous forward push of the high-water-mark (HWM = deepest rank reached).

A new epoch begins when the user, after regressing below HWM, advances HWM beyond its prior max — i.e., resumes scanning into territory not yet visited.

n_epochs = 1 □ pure forward (any regressions did not later push the HWM further). n_epochs = 2 □ one regress-scan-regress cycle. n_epochs ≥ 3 □ multiple cycles. "% multi-cycle" below = trials with n_epochs ≥ 2.

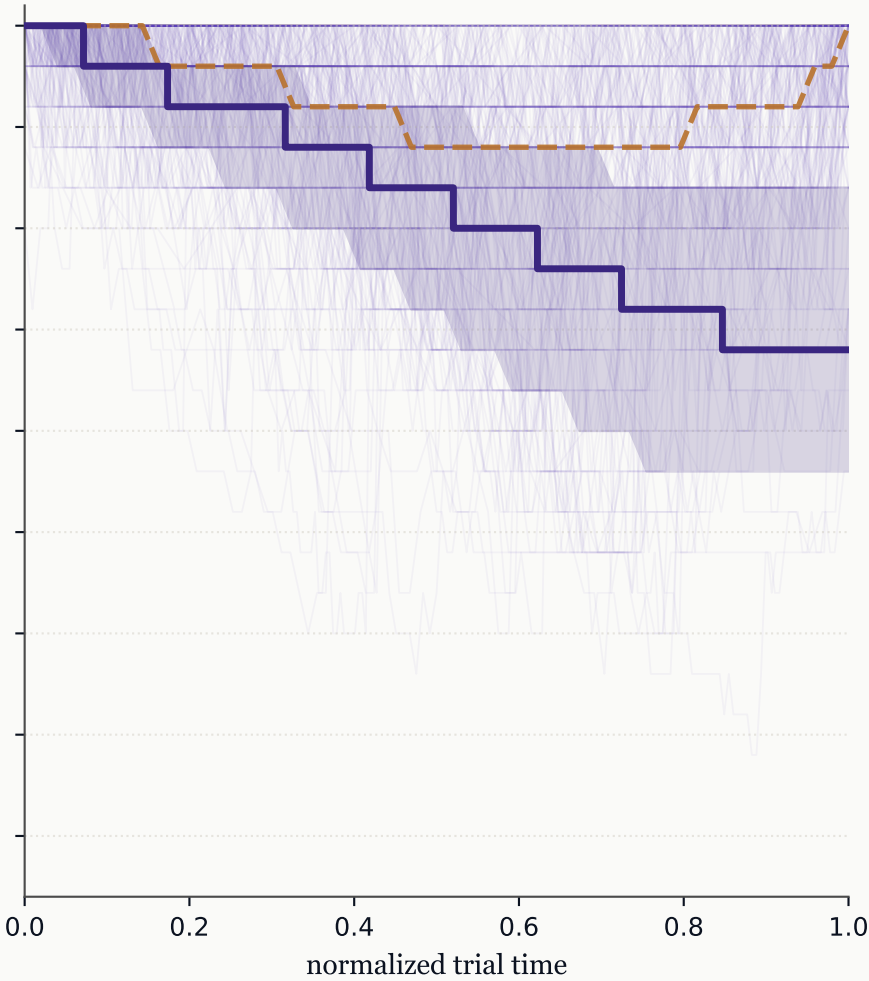

Satisficer (low regression rate)

15 participants · 878 trials · median regression rate 0.92

59% multi-cycle · median n_epochs 2 · median 38 fixations

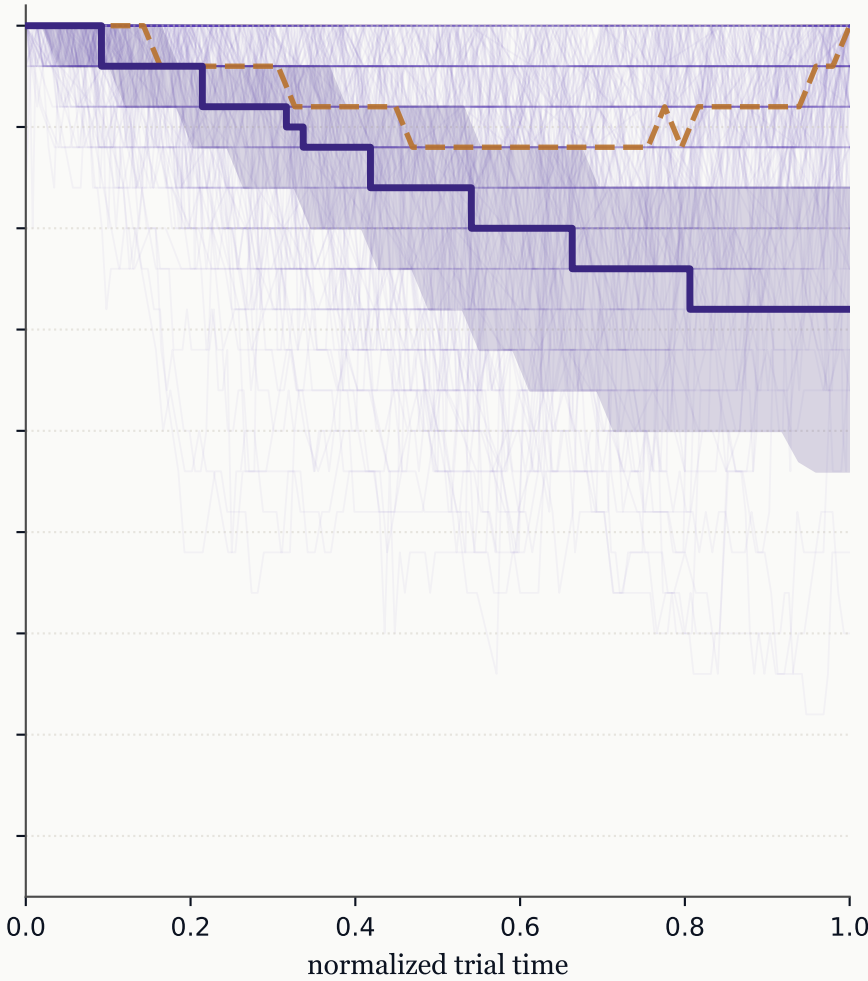

Mid

17 participants · 1,009 trials · median regression rate 1.00

87% multi-cycle · median n_epochs 3 · median 85 fixations

Optimizer (high regression rate)

15 participants · 886 trials · median regression rate 1.00

88% multi-cycle · median n_epochs 3 · median 78 fixations

— median HWM (the staircase) - - - median position fixated (the dips) HWM IQR (P25-P75)
