

ONE CLOCK. MANY VIEWS.

2,650 trials / 47 participants

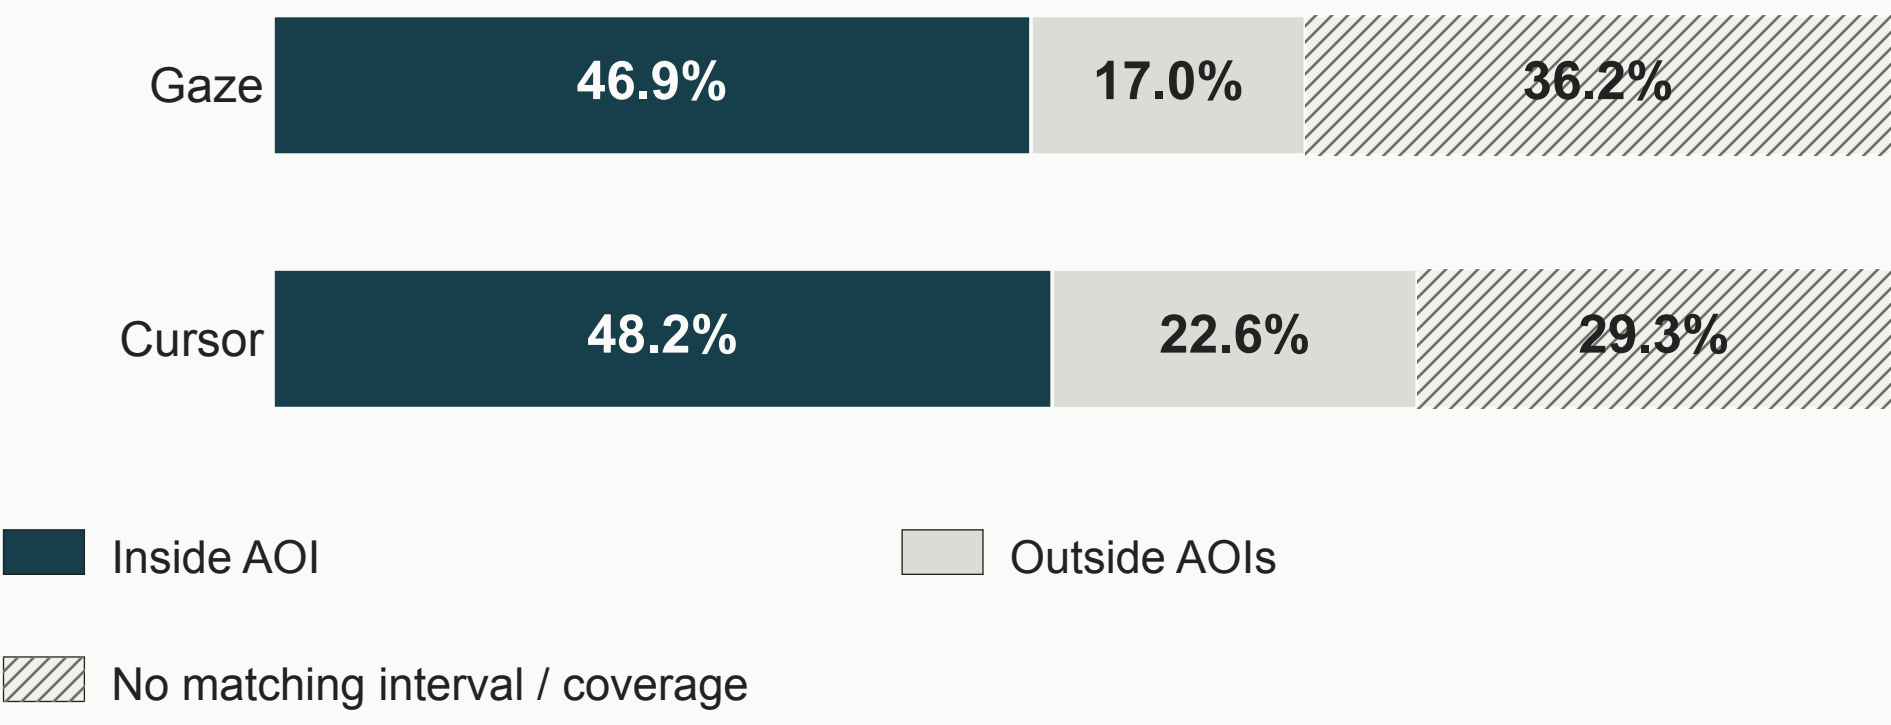

Gaze, cursor and click — an information-space atlas

13.34 hours from first mousemove to final press

All spatial budgets use this clock; motion uses complete 100 ms windows.

01 IN / OUT OF AOIs

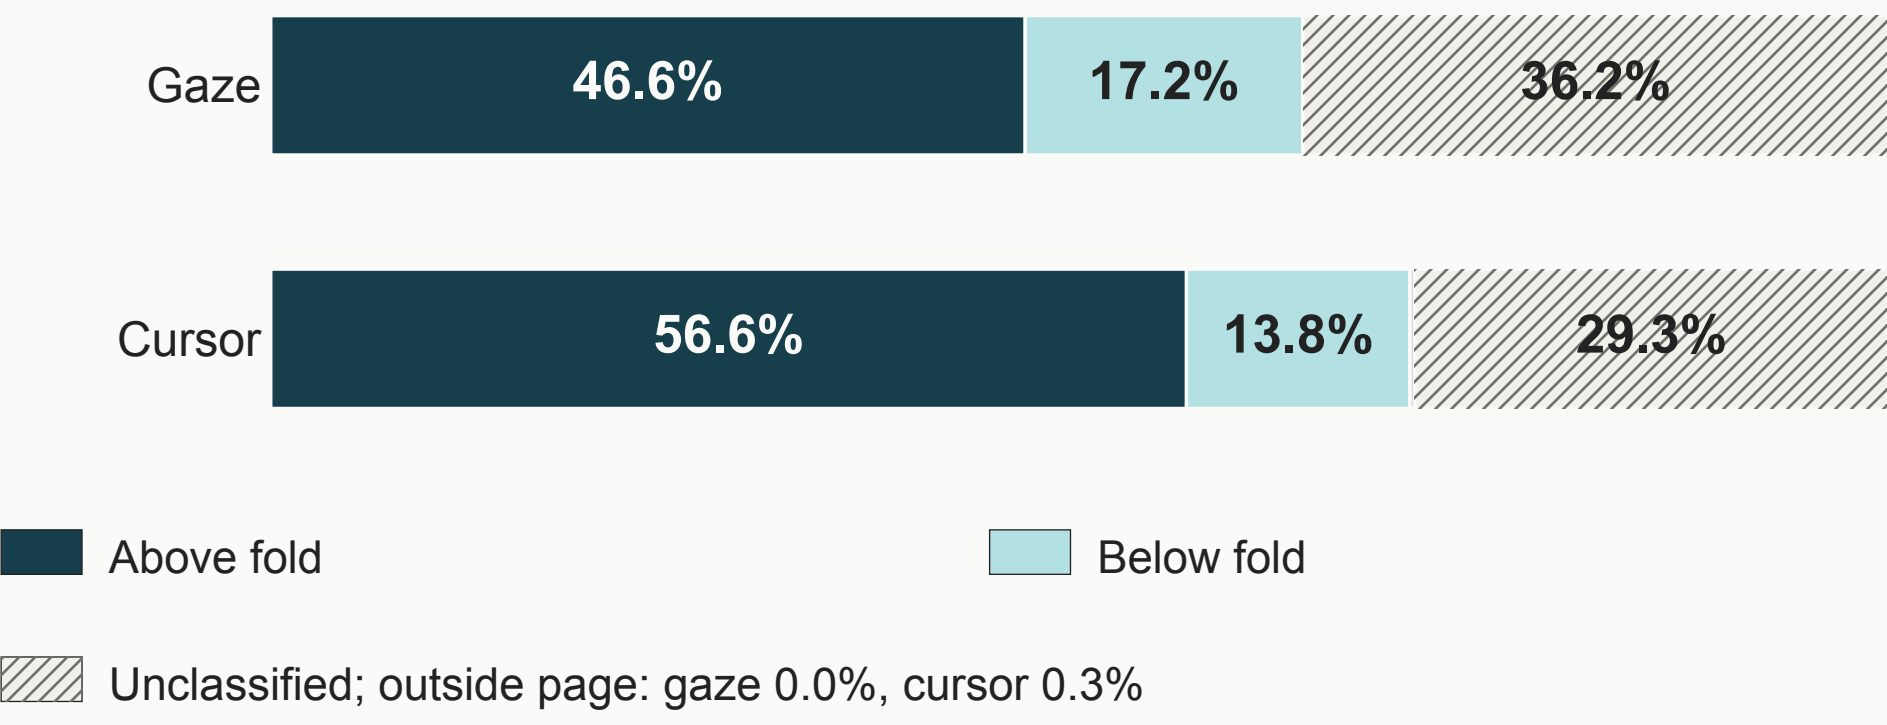

Recorded fixation location and held cursor position

In AOI: gaze 46.9% [45.1–48.4]; cursor 48.2% [43.0–53.5]

02 ABOVE / BELOW FOLD

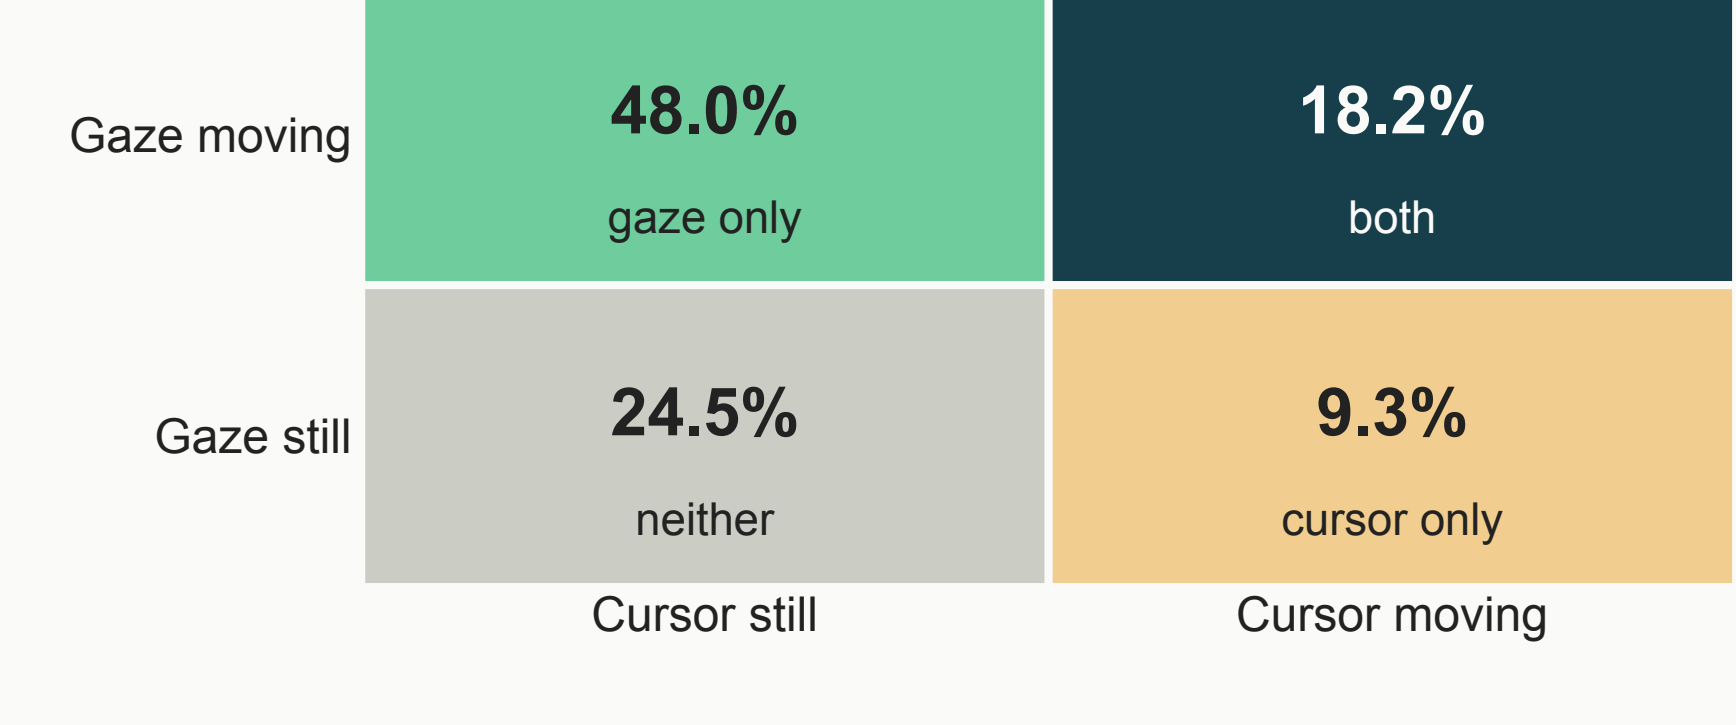

Point location relative to the initial viewport bottom

Below fold: gaze 17.2% [15.5–18.8]; cursor 13.8% [11.5–16.3]

03 MOVING / STATIONARY

100 ms displacement, independent of fixation labels

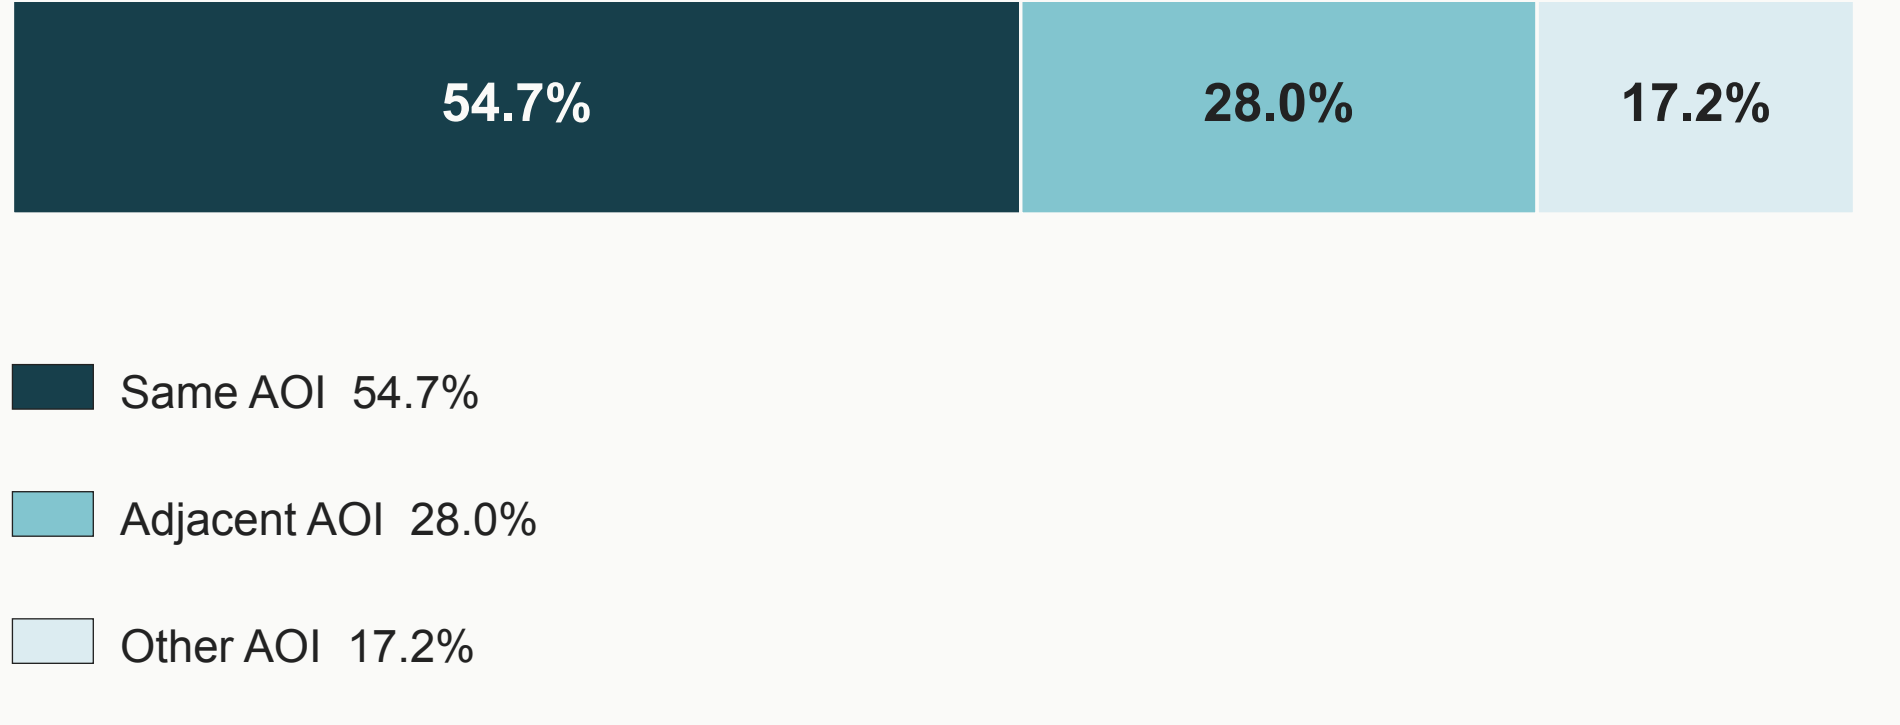

57.1% of complete windows classifiable; others excluded here.

Moving = gaze ≥300 px/s; cursor ≥50 px/s. Still = below threshold.

04 TOGETHER / APART

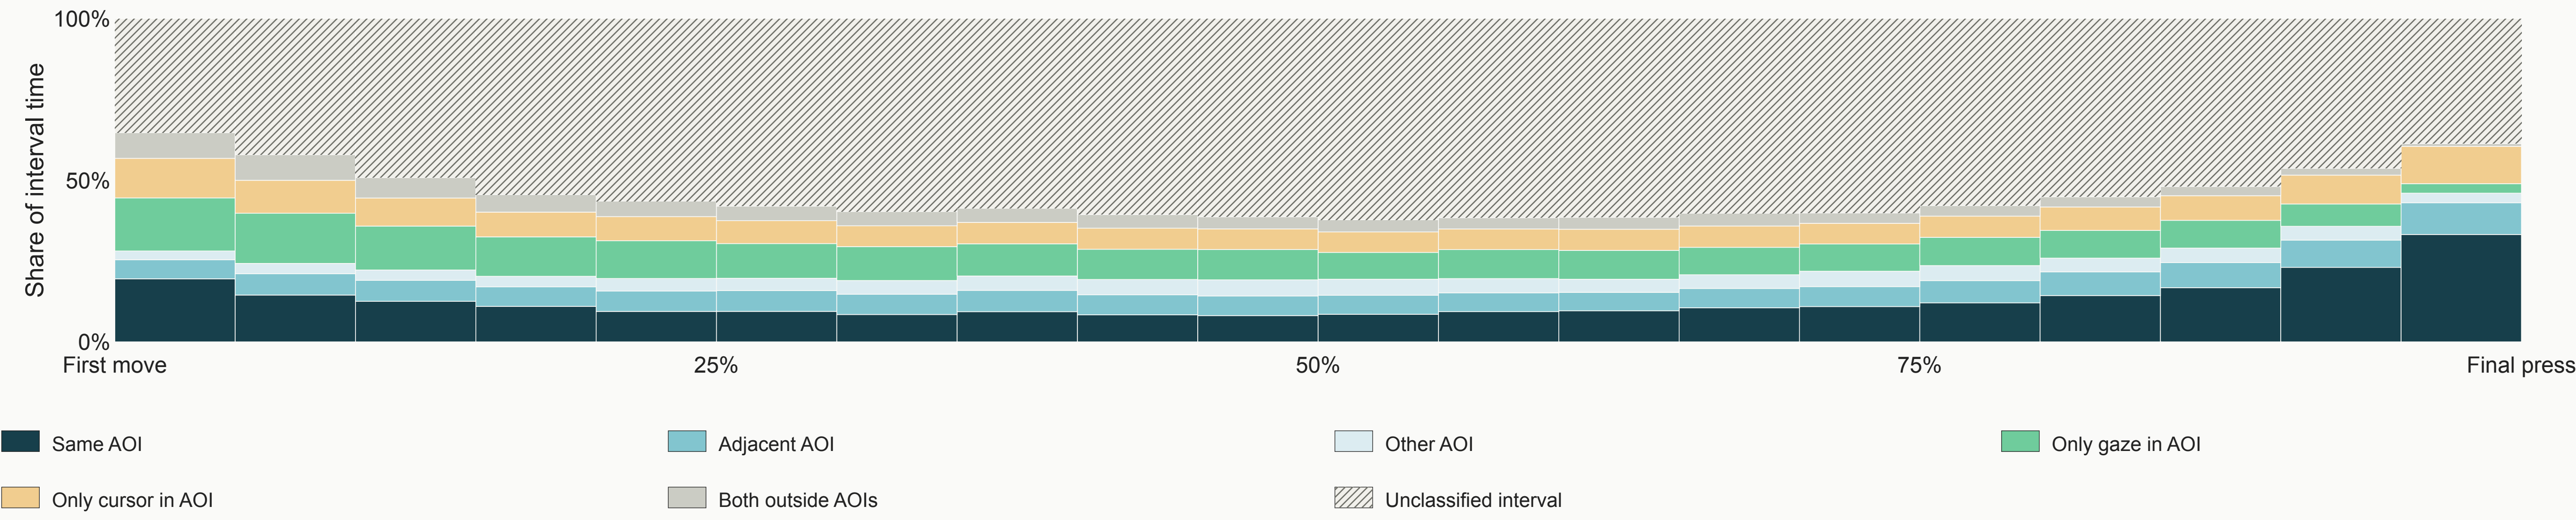

AOI identity when both signals occupy mapped AOIs

Both in AOIs: 23.7% of the full clock. Exact xy boxes.

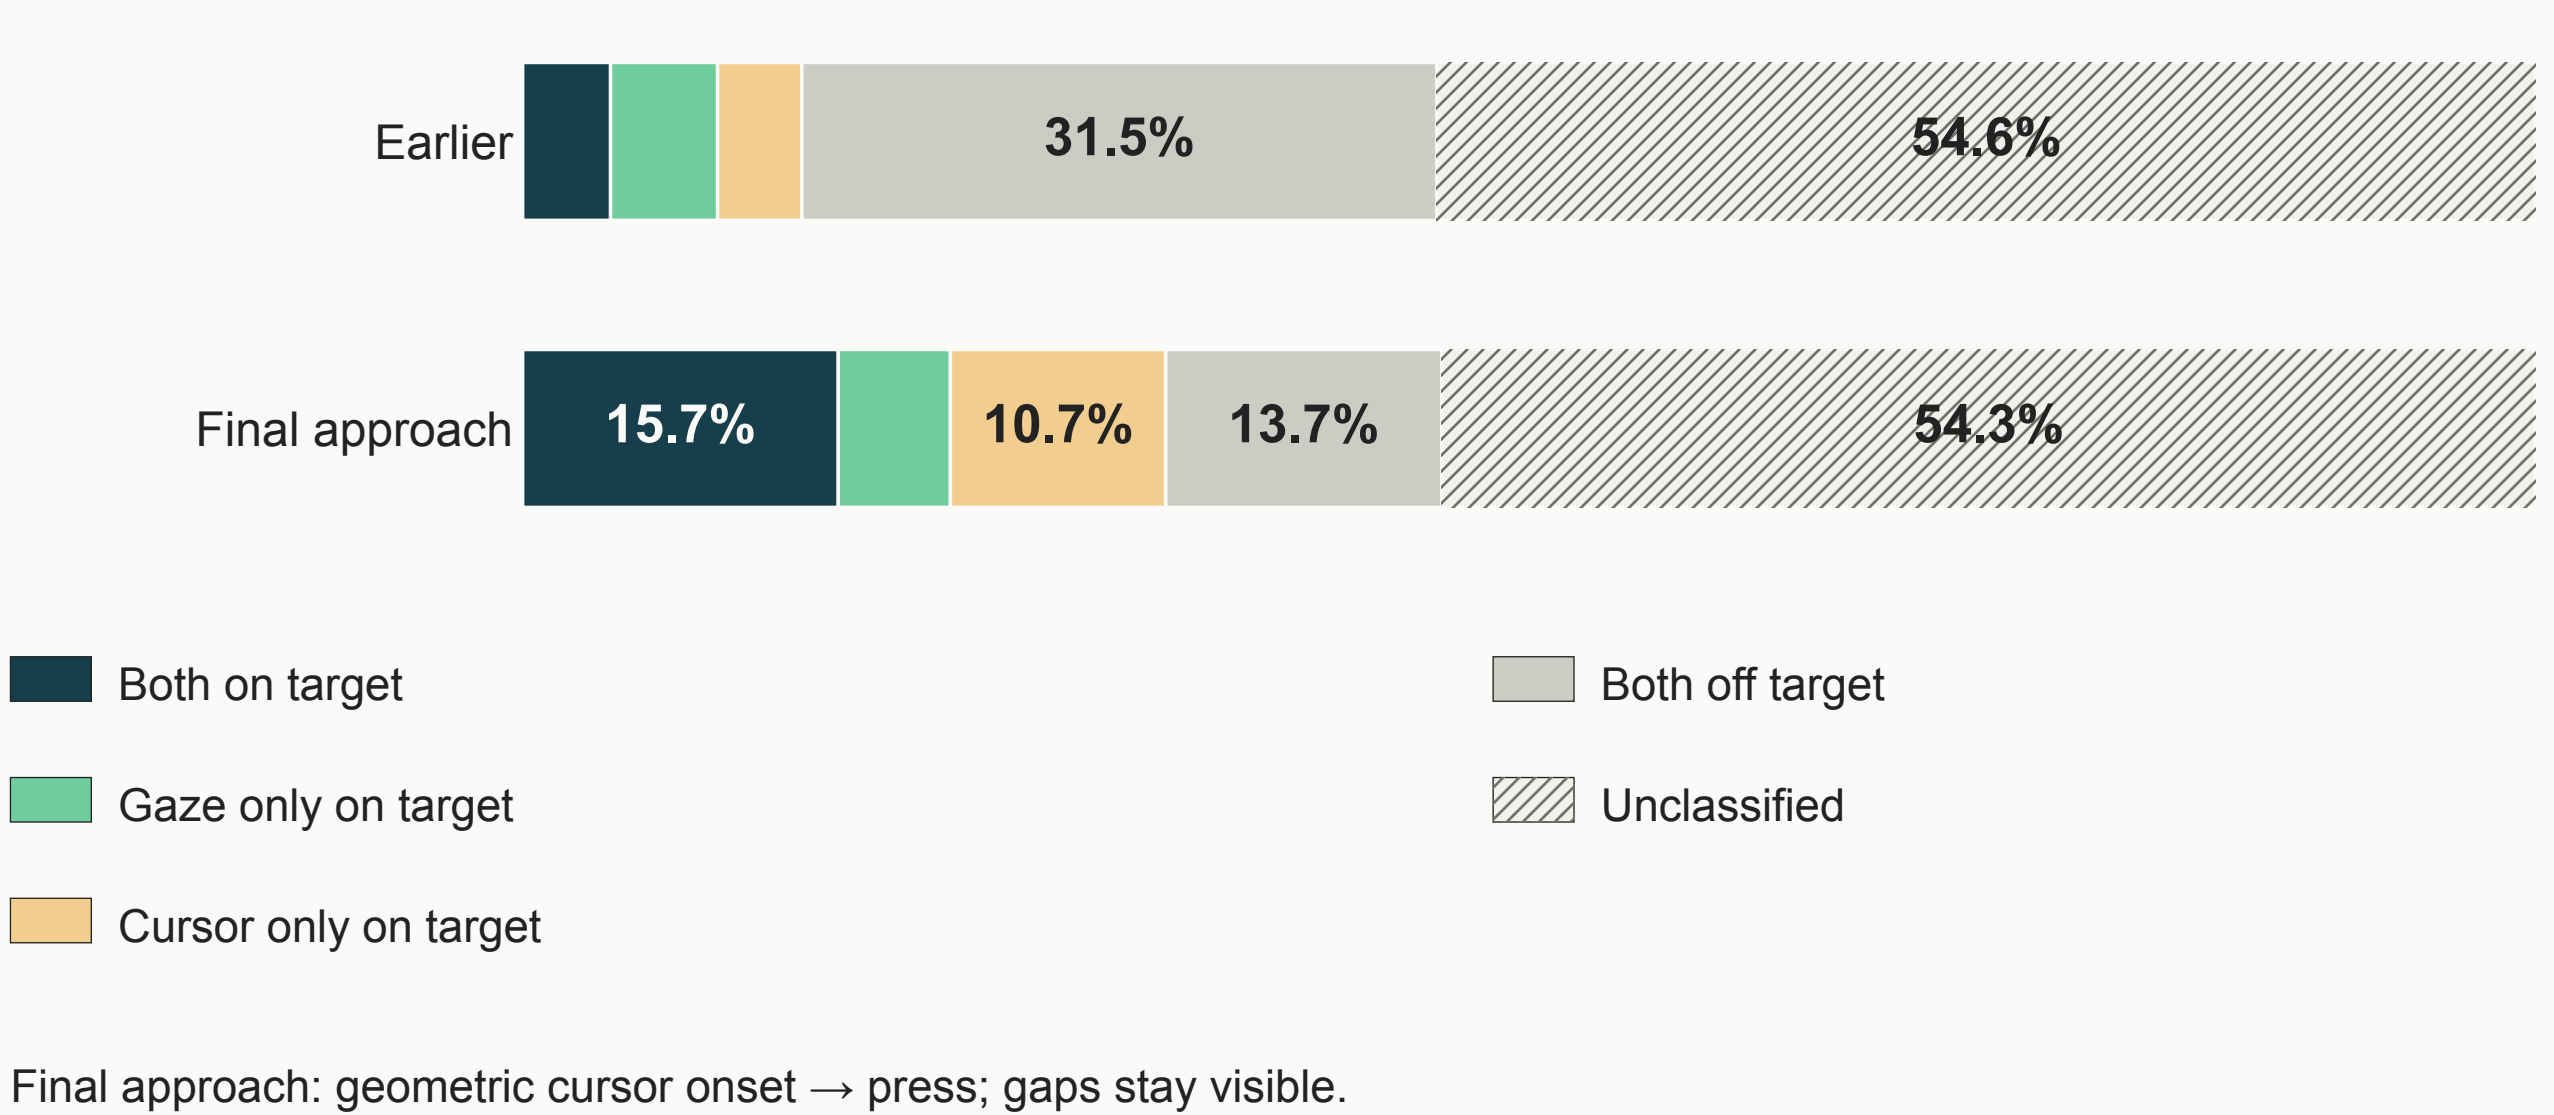

05 HOW THE SHARED CLOCK CHANGES

Duration-weighted composition within each twentieth of a trial

06 THE EVENTUAL CLICK TARGET

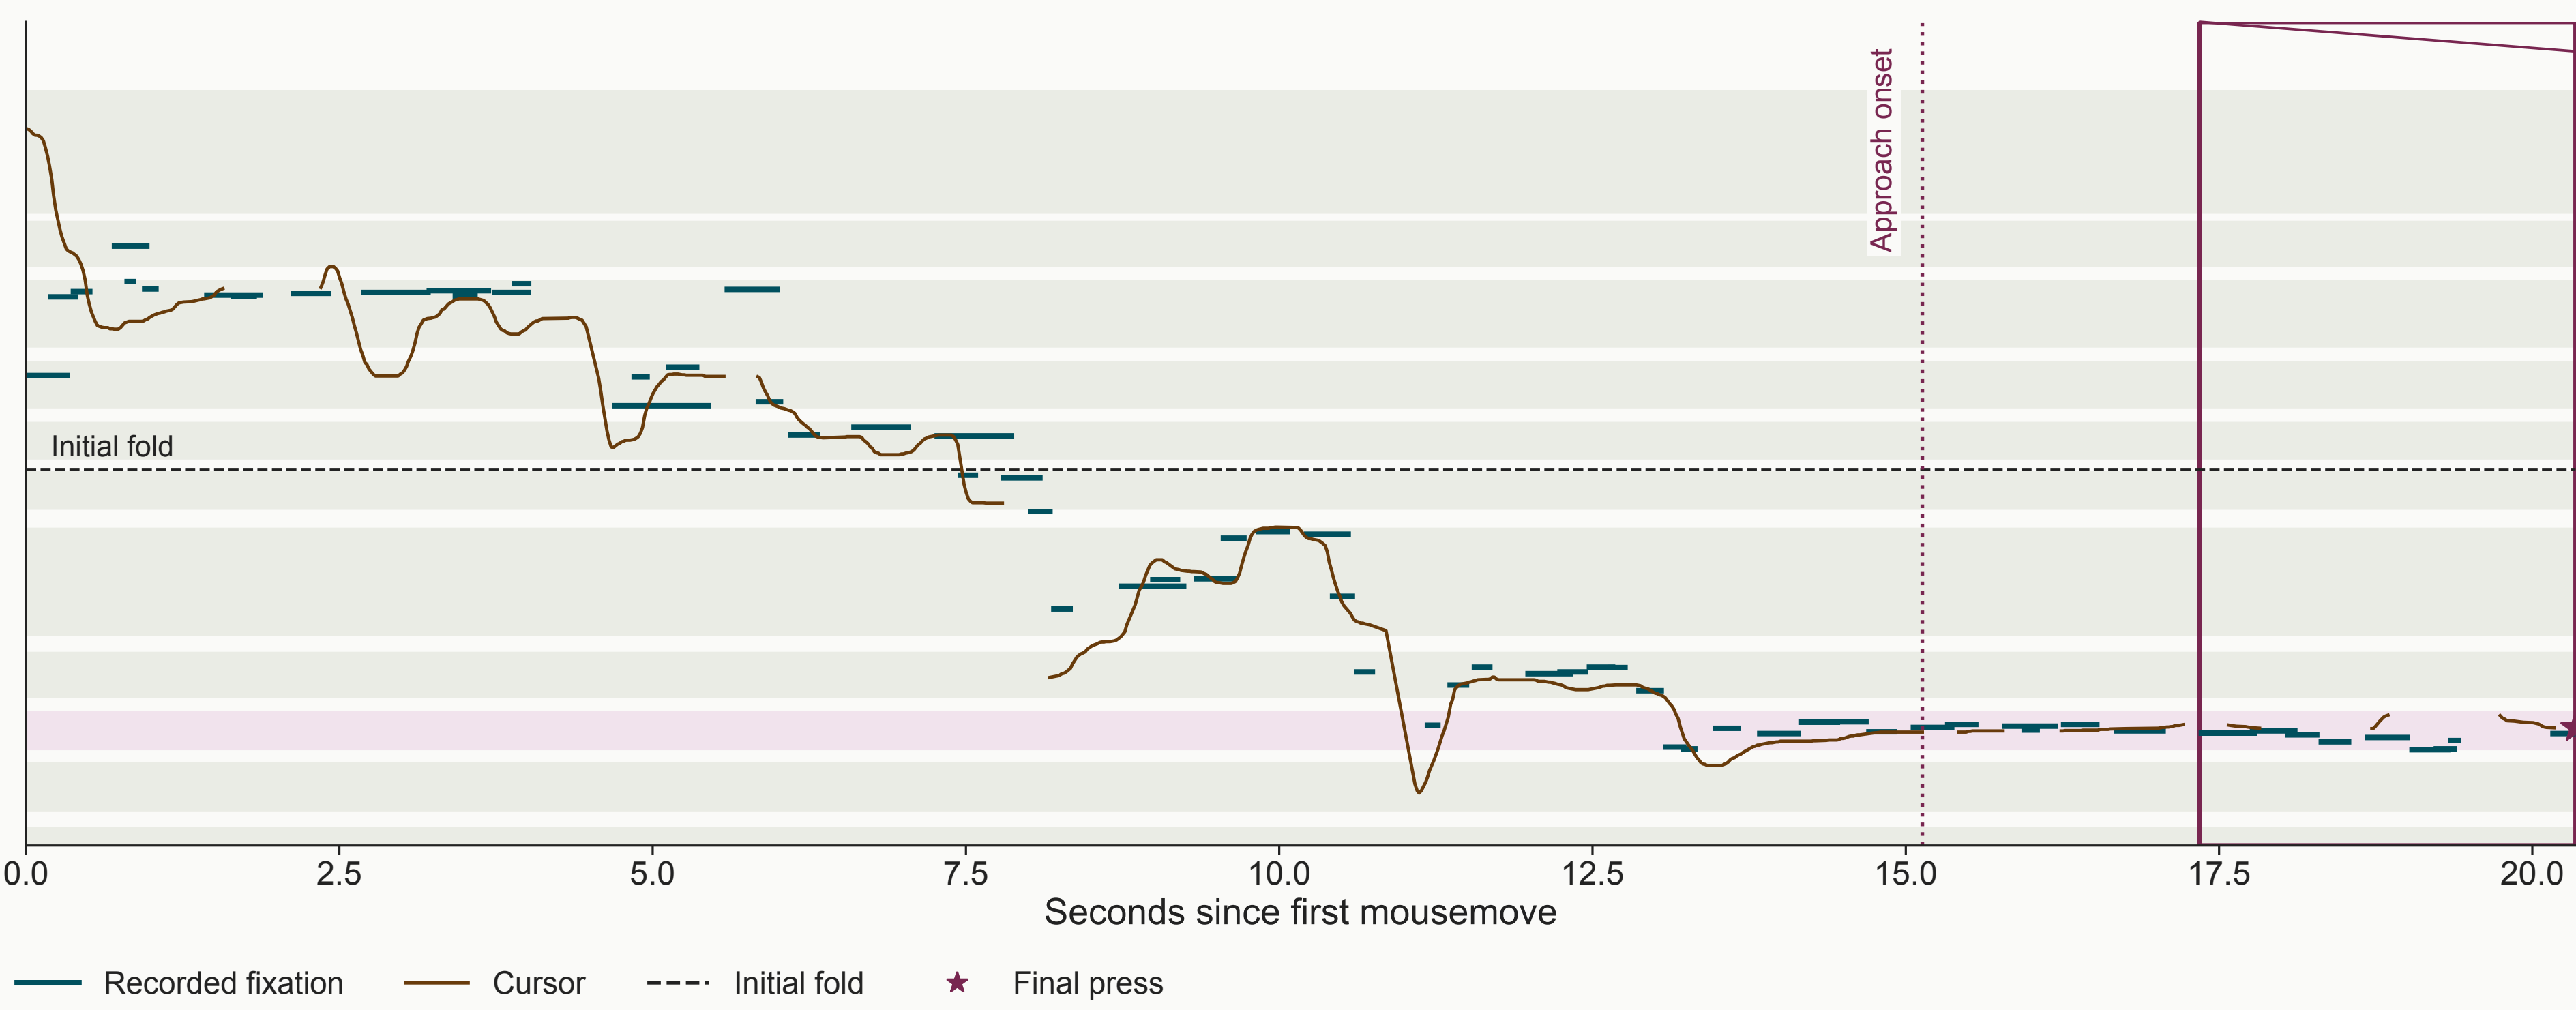

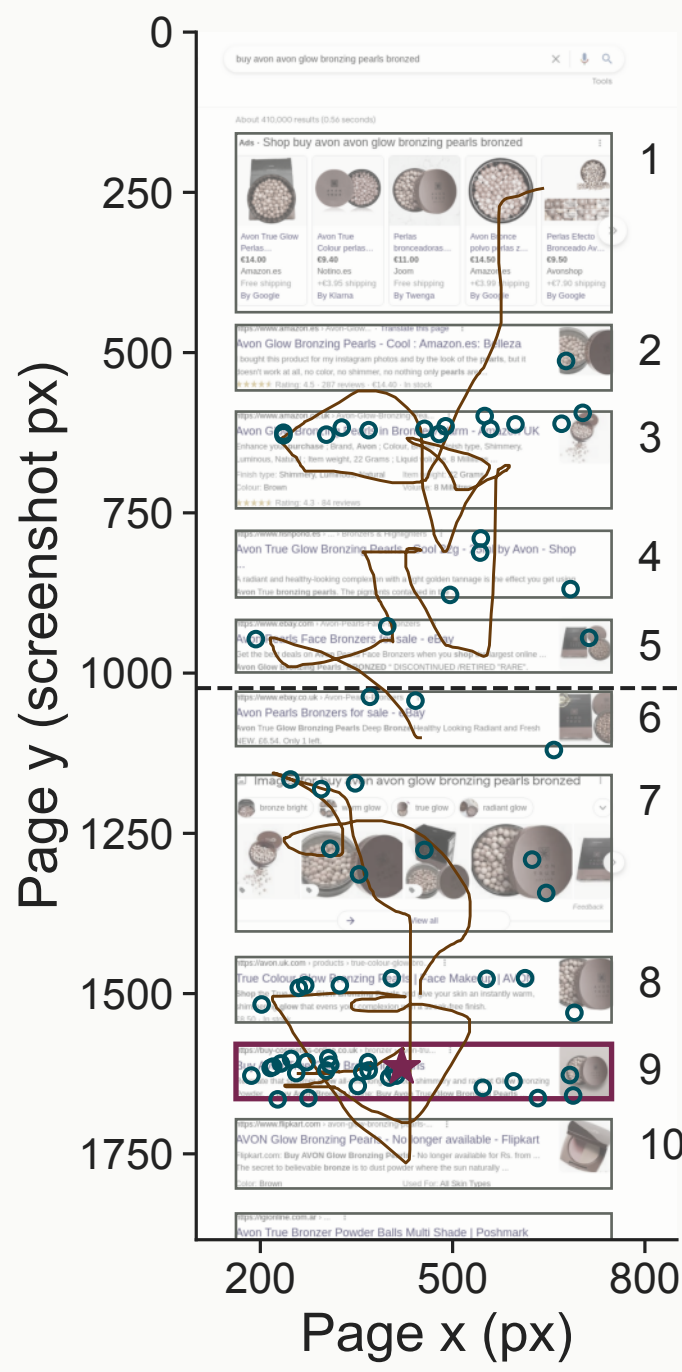

Same clock, conditioned on the clicked AOI and phase

Final approach: geometric cursor onset → press; gaps stay visible.

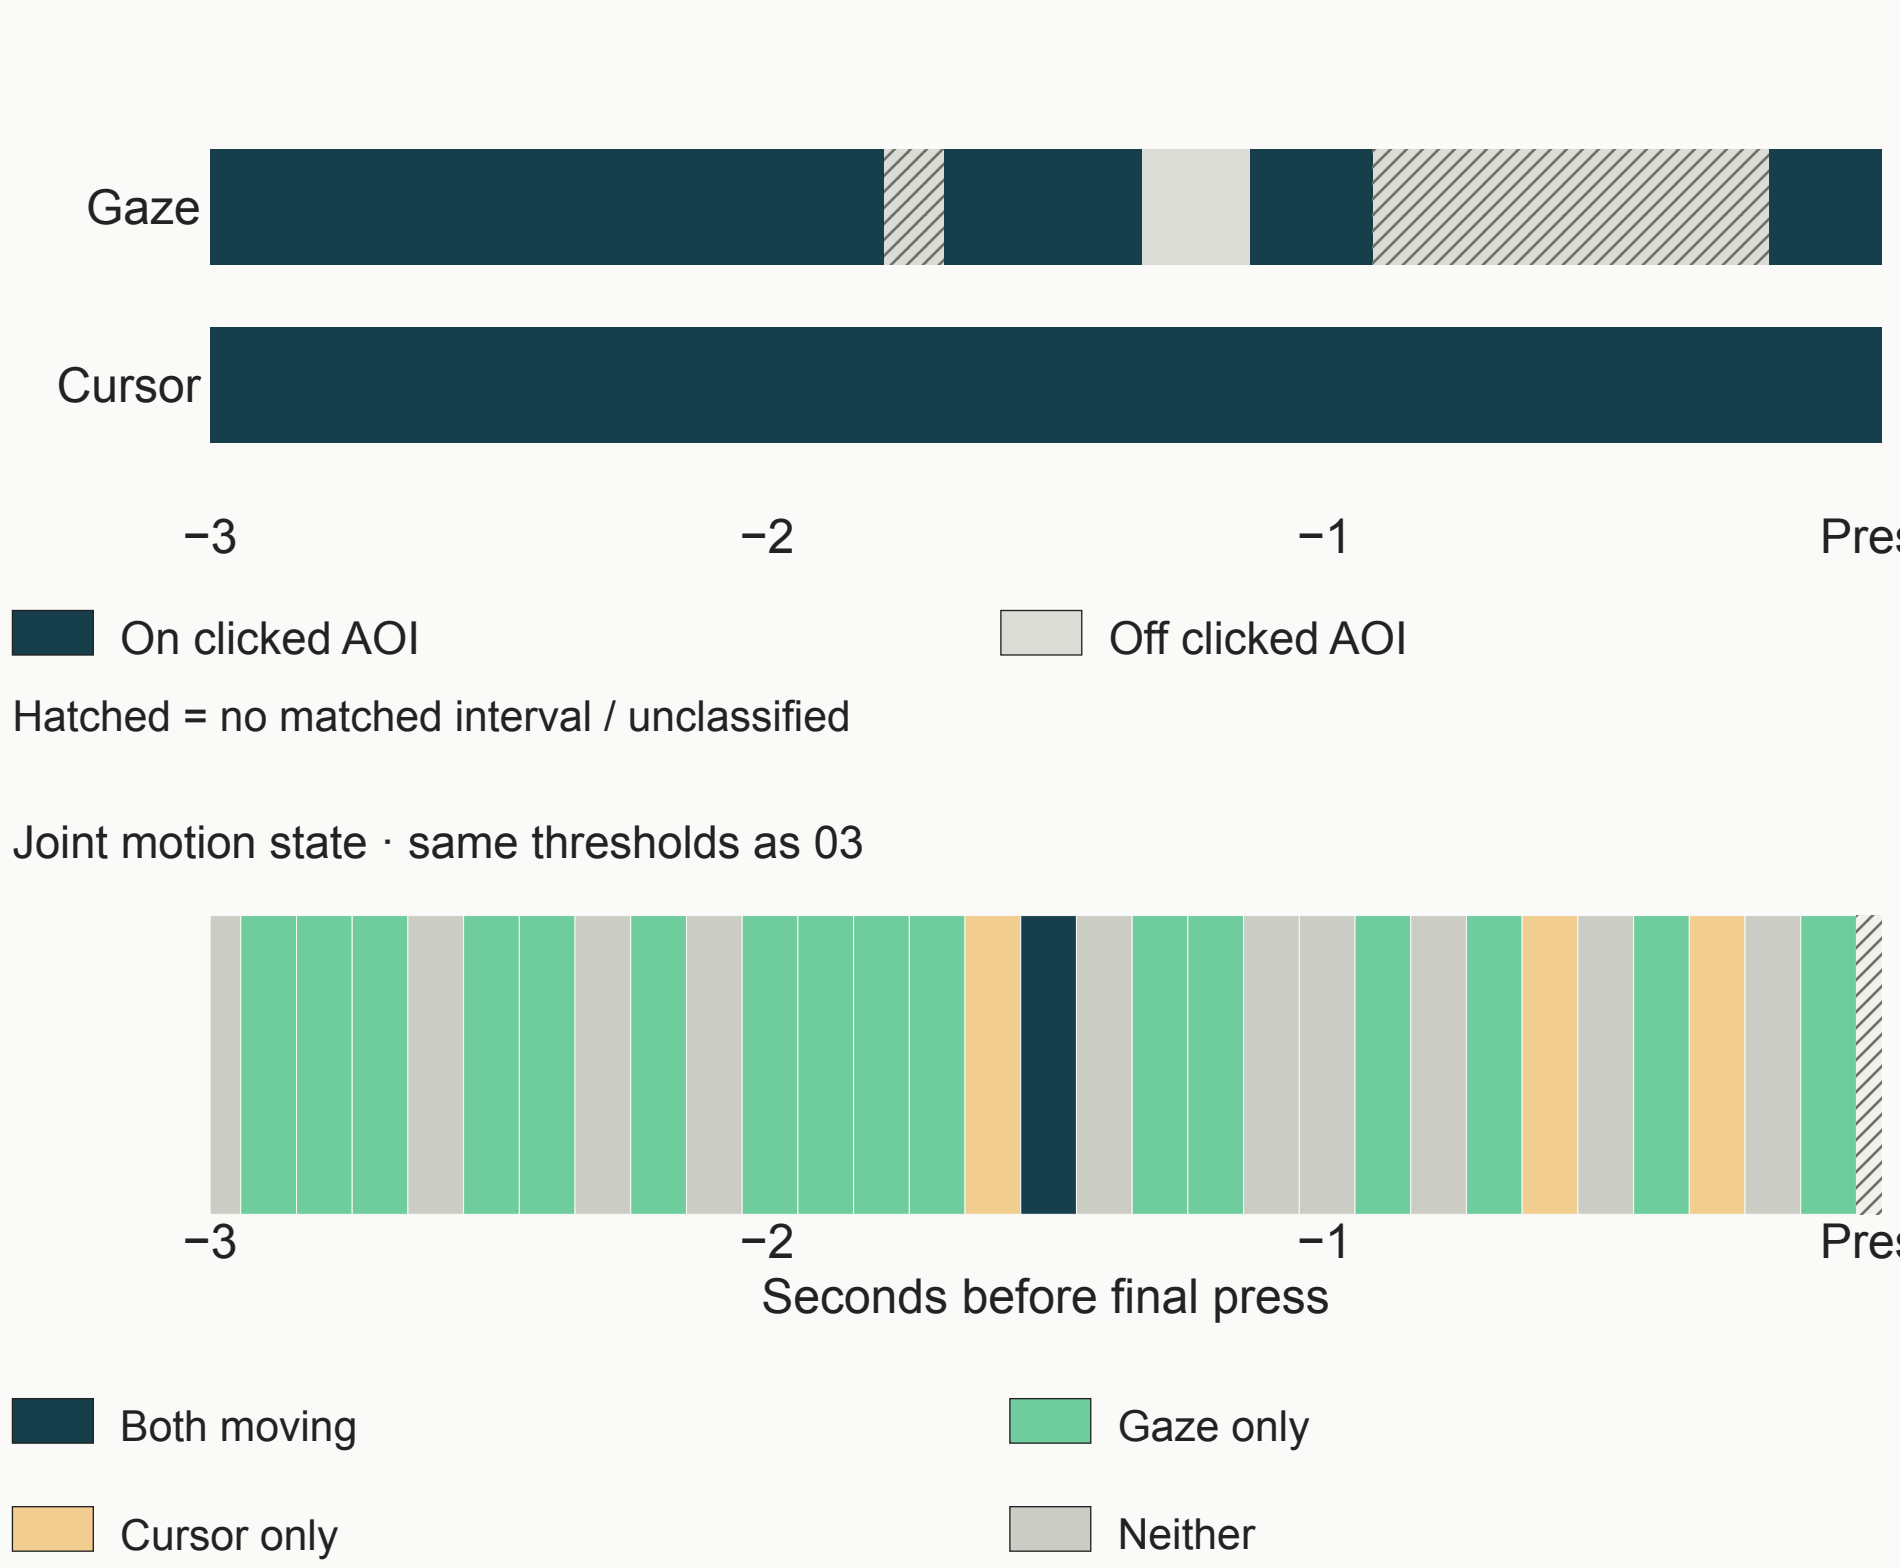

07 ZOOM TO ONE OBSERVED TRIAL

p047-b6-t1 · 20.3 s to final press · clicked AOI 9 · original screenshot + same time axis

08 ZOOM TO THE FINAL 3 SECONDS

Target-relative location and motion, on the same clock

READING THE MEASURES

AOI = mapped main-column rectangle (strict x,y).
Off-AOI includes gutters and gaps. Missing fixation ≠ eye motion.

ONE CLOCK, EXPLICIT COVERAGE

Cursor held ≤2 s; recorded fixation durations overlap exactly.
Fold = initial viewport bottom in page coordinates; it does not move.

MOTION & UNCERTAINTY

Motion = smoothed endpoint displacement; scrolling bins excluded.
Brackets: 95% participant-cluster bootstrap CI. Full methods linked.
