

Stutter-step navigation on a results page: an idealized trial with three channels

Schematic, not data. Fixation durations, the ambient/focal contrast, the return precision and the 200 px field are the AdSERP medians in docs/ablations/major_saccade_selection.md, return_is_memory.md and periphery_navigates.md. Result bands are 80 px, as on the typed AOI map.

(b) The same trace as a staircase: vertical position over time
